MEMORANDUM

Date: December 13, 2018

Prepared for: Village of Floral Park

Prepared by: Christopher Carleo
Thomas P. Clark
The Vertex Companies, Inc.

Subject: Data Summary for Early Works Site Investigation Report, Floral Park Area, October 30, 2018
LIRR Expansion Project
Project No. 46408

This memorandum provides a summary of the data provided in the Early Works Site Investigation Report (SIR) for Floral Park, dated October 30, 2018. Figures showing sample locations, taken from the SIR, are attached to this review memorandum. Samples were collected from the following areas where work is planned:

- Retaining wall Installation along the LIRR ROW (Stations 111+00 to 132+50);
- Floral Park Station Elevators;
- Floral Park Station Surrounding Site Work;
- South Tyson Avenue Viaduct;
- Floral Park Substation; and
- Linden Avenue Underpass Extension.

A total of 36 samples were collected from 14 locations. The attached tables, taken from the SIR, summarize sample location, depth, results, and soil classification for disposal or reuse. The descriptions of the soil classifications taken from the SIR is also attached.

As the tables show, concentrations of contaminants exceed regulatory soil cleanup objectives (SCOs) or soil cleanup levels (SCLs) in 18 of the samples.

- In 17 samples, concentrations of organic or inorganic chemicals exceeded the SCO for Unrestricted Use, which are the most restrictive levels. In VERTEX’s opinion, because the locations of soil in the planned work areas are generally under streets or within the railroad right of way (ROW), SCOs for commercial or industrial use, which are usually
much higher, are applicable to soil which will be excavated. SCOs for commercial or industrial use are not exceeded in any sample.

- In 3 of those 17 samples, concentrations of acetone exceeded the SCO for Unrestricted Use for acetone and no other constituent. The SIR interprets these exceedances as resulting from cross-contamination of samples with solvents used for decontamination of sampling equipment. In VERTEX’s opinion, this is a reasonable interpretation.

- In 6 samples, concentrations of petroleum constituents exceeded the SCL for Gasoline/Fuel Contaminated Soils. SCLs for petroleum constituents are typically the same as the SCOs for Unrestricted Use.

- In 8 samples, concentrations of pesticides exceeded the SCO for Unrestricted Use for pesticides.

- Dioxins were not detected in any sample.

In addition to laboratory analysis, soil samples were evaluated using field screening methods. The field screening methods included measuring concentrations of organic vapors using a photoionization detector (PID) and observing for odors or visual evidence of impacts (staining). A review of the boring logs from the sampling indicates there were no significant differences between field screening results for samples where laboratory analysis indicates there were exceedances of SCOs and those where there were no exceedances.

In VERTEX’s opinion, the concentrations of soil detected in soil samples are consistent with fill material present in urban areas and can be managed effectively through the implementation of proper soil handling methods. For this reason, it is important that the Village require 3TC to follow appropriate procedures for handling contaminated material.

Analytical Results Summary
• **Boring EB51**: PID readings were 5.4 ppm of depth EB51-0-2 ft bgs of black to dark brown sand and medium to fine texture. PID readings were 4.7 PPM of depth EB51-2-4 ft bgs of black to dark brown sand with medium to fine texture. PID readings were 4.3 ppm of depth EB51-4-6 ft bgs of black to dark brown sand with medium to fine texture. PID readings were 6.7 ppm of depth EB51-6-8 ft bgs of brown sand with medium to fine texture. PID readings were 3.4 ppm of depth EB51-8-10 ft bgs of brown sand with medium to fine texture. PID readings were 3.4 ppm of depth EB51-10-12 ft bgs of black moist sand to light brown sand with medium to fine texture. No odor was detected.

• **Boring EB52**: PID readings were 0.0 ppm of depth EB52-0-2 ft bgs of sand with gravel of medium to fine texture. PID readings were 0.0 ppm of depth EB52-6-8 ft bgs of sand with pebbles with medium to fine texture. No odor was detected.

Boring logs are presented in Appendix B.

### 3.2 Soil Analytical Results

The soil analytical results are presented in Appendix A. Summaries of the results for each sample are provided in Table 2 below:

<table>

### Dioxin

Fourteen (14) samples were collected from 0′-2′ bgs from borings EB1, EB2, EB3, EB4, EB5, EB6, EB46, EB47, EB48, EB49, EB49A, EB50, EB51 and EB52 and tested for dioxin. The results were compared to the EPA Regional Screening Levels (RSL) for dioxin mixtures. The RSL for residential soils is 0.0001 milligrams per kilogram (mg/kg) (100 picograms per gram [pg/g] of 2,3,7,8-Tetrachlorodibenzodioxin (TCDD). The RSL for industrial soils is 0.00047 mg/kg (470pg/g) of TCDD.
A summary of the dioxin soil sampling results is presented in Table 3.
